The prevalence of mental illness in the youth population has not increased, but our awareness of children and adolescents with mental health problems has. Similarly, as medical knowledge and awareness of these issues grow, so must our ability to diagnose and properly treat children and adolescents with mental health problems. The needs of youth with mental illness are being neglected. Families are denied services, placed on extreme waiting lists, or services simply do not exist. The situation has negative consequences for the youth, the families, and communities.

- Nationally the prevalence of mental disorders is higher in juvenile justice population than the general population.
- 70-100% of youth in the juvenile justice system have a diagnosable mental disorder.
- 1 in 5 (20%) of these youth will have a serious mental disorder.
- In 2003, 12,700 families relinquished custody of their children for the sole purpose of accessing mental health services for their child, 9,000 to the juvenile justice system.
- The rate of suicide among juveniles while incarcerated is four times that of youth overall.
- 11,000 youth engage in 17,000+ acts of suicidal behavior annually.
- Youth with mental health disorders are at increased risk of victimization by other in juvenile detention centers.
- Reports estimate that juvenile detention facilities spend $100 million each year to house youth who are waiting for mental health services.

Without adequate community services many of our youth end up in the criminal justice system. These environments are not supportive and often exacerbate their mental health problems. Many of the techniques used in correctional facilities like prolonged isolation and restraints actually lead to increased, not decreased acting out, antisocial behavior, and self-harm, particularly among youth with mental illnesses. Often correctional facilities are slow to respond to the needs of undiagnosed youth leading to further deterioration in mental status, increased violations of rules, and increased discipline. The unfortunate reality is that the more experiences that youth with mental illnesses have in juvenile detention centers, the more likely it is that they will descend deeper and deeper into the criminal justice system. The initial placement in juvenile detention becomes a self-fulfilling prophecy.

**Virginia Overview**

Virginia detention centers reflect similar trends to national statistics in terms of a disproportionately high number of youth with mental illness in the correctional system and the acute need for care by these youth.

- A 2012 study found that 60% of males and 80% of females in Virginia Detention Homes are in need of mental health services. The same study found that 62% or males and 76% of females had a history of psychototropic medication use prior to commitment.
- A 2007 study indicated an increase with 65% of youth committed to Virginia’s justice system have a diagnosed mental illness prior to admittance.
- The study also found that girls once in the system have more mental health problems due to trauma and abuse.
- Virginia has 48 state psychiatric beds for children and 224 private psychiatric beds for adults.
Recent Developments in Virginia

- In 1993 Virginia created the Comprehensive Services Act (CSA) designed to provide the Commonwealth youth with child-centered, family-focused, community-based and cost-effective treatment. This program pools funds and resources to best meet the needs of the youth and would effectively end the practice of custody relinquishment for treatment in Virginia if funded adequately. Mandated populations, such as foster care, received $263.7 million in 2005 while non-mandated populations received only $9.5 million.\textsuperscript{viii} Juvenile offenders fall into the non-mandated category.

- In 2000 the General Assembly appropriated $500,000 for 2 years toward the recruitment and retention of psychiatrists in medically underserved areas.\textsuperscript{xvii}

- In 2005 Virginia funded a community based program through eight of the state’s Community Services Boards. The programs target children with mental illness in the detention centers providing assessments, case management, group counseling, individual counseling, crisis intervention, medication.\textsuperscript{xviii}

- After the shootings at Virginia Tech, the 2008 General Assembly appropriated $5.8 million to children's mental health and $1.9 million to help with the training for law enforcement as first responders to crisis.\textsuperscript{xix}

Next Steps and Needed Developments

- More formal interagency commitment and collaboration are needed to plan integrated, comprehensive service delivery systems for juvenile offenders with mental illness.\textsuperscript{xx}

- Divert youth with mental health issues from the criminal system by developing robust in-home and community-based services to prevent serious crisis. Services include crisis stabilization, family support, respite, in-home, and psychiatric care. With effective and evidence-based treatment and supports, children and youth with serious mental illness can experience success in the home, school, and community.\textsuperscript{xxi} A crucial aspect to the success of these services is adequate and accurate screening instruments for early identification.
